

THE 100X CRYPTO PATTERN

The 100X Crypto Pattern

Some people think crypto is just a fad.

And they are just flat-out wrong.

The trend is here to stay... but it's taken people years to believe that crypto has legs.

I've been tracking this space for over a decade — in 2013, I told people to buy Bitcoin at \$63.

I set up the first online bookstore that accepted only Bitcoin. I sold my book *Choose Yourself!* exclusively for Bitcoin. CNBC had me on, also in 2013, to talk about Bitcoin. I called it the “Choose Yourself currency.”

Later, I said Bitcoin was going to \$50,000. People laughed.

It was like when in the 2000s I said on Larry Kudlow's show, "Apple will be the first trillion-dollar company." Everyone laughed then, too. Or when in 2007 I said on CNBC that Facebook would be a \$100 billion company. Laughter. *Impossible. Who is this guy!?*

Of course, you already know what happened to Apple. To Facebook. **And** to Bitcoin. In 2021, Bitcoin shot up way past \$50,000.

And I think it'll go higher. Way higher.

Yes, crypto-millionaires and billionaires will certainly be minted in the coming years. There will be plenty of rags-to-crypto-to-riches stories to go around.

And maybe you will be one of them... if you are careful.

They might have laughed at me back in 2013, but now it seems that everyone is jumping on the crypto train...

Most notably, BlackRock — previously a “no-coiner” — dove headfirst into the crypto space with its own Spot Bitcoin ETF.

The ETF is attracting billions more from investors, with plenty more to come...

In the past few weeks, BlackRock added five additional authorized participants (APs) to the iShares Bitcoin Trust, including Goldman Sachs, Citadel, Citigroup and UBS as well as clearing house ABN AMRO.

I point this out because not only are these some of Wall Street's banking giants, but Goldman Sachs has been pretty vocal about crypto having “no value,” (I suspect they would've laughed at me as well when I was championing crypto years ago).

Despite this, the big bank followed in

the footsteps of JPMorgan, whose CEO bashed crypto for years... only to become one of the original APs for BlackRock's ETF when it launched in January.

It's no coincidence that all of this is happening right before the event called the Bitcoin "halving", which has to do with the number of new Bitcoins that can be created...

As you might know, new Bitcoins are brought into circulation by a process called mining...

And that's where the halving comes in. Because, as the name implies, every four years on the dot, a halving occurs — cutting the amount of Bitcoin created from mining by 50%.

So each time a halving occurs, the supply of Bitcoin in the market gets scarcer and scarcer.

And it goes without saying that when the

supply of new Bitcoin gets cut in half overnight, it causes Bitcoin to go much higher.

What's more — historically, it's had a profound impact on not just Bitcoin's price action, but the trajectory of the entire crypto space.

But here's what you might be missing: As we approach the next halving, expected to take place in April 2024, it's important to understand the five distinct phases of the Bitcoin halving cycle.

So before we get into specific plays to take advantage of this huge crypto event, let me give you a little backstory on these halving phases and what they mean for the crypto market... and you.

Phase 1: Pre-Halving Downside Period

The pre-halving downside period typically lasts several months and is characterized by a pullback in Bitcoin's price. This phase

was evident in late 2023 and early 2024.

One of the main reasons for the downside movement in this phase is the anticipation of reduced mining rewards. As the halving approaches, miners and investors alike begin to factor in the potential impact of the decreased supply of new Bitcoin entering the market. This concern can lead to a sell-off, as some participants aim to lock in profits or mitigate potential losses.

Phase 2: Pre-Halving Rally

The pre-halving rally phase usually begins 60 days before the halving event. In the current cycle, this breakout has occurred slightly ahead of schedule compared to previous cycles. We all know why. Three letters: ETF.

Now, here's the thing: Typically, as Bitcoin breaks through old all-time highs, it's common to see increased volatility in the market. A closer look at previous cycles reveals that this seems to be a psychologi-

cal inflection point for investors, leading to both upside and downside swings.

In 2017, for example, Bitcoin initially overshot the old all-time high before pulling back and retesting the level as new support. Similarly, in 2021, the market experienced multiple pullbacks and consolidation periods around these key levels before continuing its upward trajectory.

Phase 3: Pre-Halving Retrace (YOU ARE HERE)

About 4-6 weeks before the halving event, Bitcoin begins a pre-halving retrace.

In the 2020 cycle, a 20% retracement occurred two weeks before the halving, while in 2016, a 29-40% pullback took place 28 days prior. Similarly, recent market action has seen a healthy dip. This retrace normally presents one of the last bargain-buying opportunities before the halving.

Phase 4: Post-Halving Re-Accumulation Period

Contrary to popular belief, the Bitcoin halving does not immediately trigger a massive rally due to supply shock. Historical data shows that the price often falls or moves sideways for months following the halving event. In the 2012, 2016, and 2020 cycles, it took between 100 and 200 days after the halving for Bitcoin to reach a new all-time high.

During this phase, which can last several weeks to a few months, Bitcoin sees sideways movement and rejection at resistance levels. This period is crucial for building a foundation for the upcoming parabolic price action.

That said, Bitcoin's supply growth rate, which has been around 1.8% annually for the past four years, is set to drop to approximately 0.9% following the halving event in April. This reduction in supply growth

will mark the first time Bitcoin falls below the supply growth rate of gold, making it an even scarcer asset.

With 15 million out of the total 19.5 million Bitcoin in circulation being held by long-term investors, or “hodlers,” this suggests that institutions will have to compete for the remaining 1-2 million Bitcoin. This competition could drive prices significantly higher, as institutions have only recently begun to embrace Bitcoin following the SEC’s approval of Bitcoin ETFs.

Phase 5: Parabolic Post-Halving Uptrend

Once Bitcoin has sufficiently re-accumulated and broken out from the re-accumulation range, it enters the parabolic post-halving uptrend. This is the most exciting phase of the cycle, where Bitcoin can go ballistic.

Extreme FOMO and price targets of \$1

million or more are common during this phase... and that's exactly what we're targeting in the coming months.

Trillion-Dollar Super-Halving

Crypto is not just gaining popularity... it's in its **golden age**.

And I'm predicting this halving will be a "Super-Halving" for three very specific reasons...

- Institutional Support
- Interest Rate Cuts
- The Dollar Losing Value

With Wall Street finally able to get in on the action...

Pent-up demand sending quick-growing tech assets higher...

And more people storing their wealth in crypto rather than the dollar...

Trillions of dollars are headed straight to the crypto market.

All of this leads into this Super-Halving and, what I predict, what could be the largest crypto boom in history.

Bitcoin Leads, These Coins Follow

Despite all that I've gone over so far, I actually don't recommend you buy Bitcoin before the coming halving.

Don't get me wrong, you could do really well.

But there are cheaper ways to benefit from Bitcoin's rise... crypto coins that are closely correlated to Bitcoin's price movement.

With this list, you can profit from the Bitcoin halving-boom, without ever owning Bitcoin.

And if you get in before the next halving starts, you have the chance to buy these

small cryptos while they trade cheaply...

Right before they skyrocket in price.

So, without further ado, here is the list of cryptos that follow Bitcoin's trends...

Ticker	Name	Correlation	Market Cap
BAT	Basic Attention Token	94%	\$438.6M
OGN	Origin Protocol	93%	\$134.6M
MLN	Enzyme	85%	\$64.6M
STORJ	Storj	84%	\$289.2M
SPELL	Spell Token	81%	\$117.8M
KSM	Kusama	80%	\$353.8M
LINK	Chainlink	72%	\$10.2B
SYN	Synapse	70%	\$258.1M

My TOP Crypto Buys: COMING THIS SUNDAY AT 7PM

As I pointed out, I predict this halving to be unlike we've ever seen... and crypto is due for an explosion higher.

And when Bitcoin goes up, it brings the

entire crypto market with it...

Because the coins we've highlighted today trade in tandem with Bitcoin, and because they trade so cheaply, they have the potential to rise alongside Bitcoin.

But these coins are solely based on *correlation* and nothing else... and there are other "alt-coins" my team and I have been researching that are even more likely to create MASSIVE profits in the weeks to come.

We're putting the finishing touches on a special invite-only presentation we'll be sharing this Sunday night — April 14 — at 7:00pm ET.

It's going to tell you exactly why this Bitcoin halving will be the "Super-Halving" that will take crypto to new heights.

And as a VIP text subscriber, I'll be updating you in real time as this once-in-a-lifetime opportunity unfolds.

You won't want to miss this.

So be sure to join the livestream where we'll reveal more details on an exciting opportunity to invest in Bitcoin's Trillion-Dollar Halving.

Thanks again for being a VIP text subscriber — I'll see you Sunday night at 7pm ET sharp.

Sincerely,

A handwritten signature in cursive script that reads "James Altucher". The signature is fluid and stylized, with the first letters of the first and last names being capitalized and prominent.

James Altucher
